Price of Apples, Pear, Plum and Peach trees is \$1.00 each.  
Grapes 40¢ each. Strawberries and Raspberries \$1.00 per dozen  
or \$5.00 per 100.

APPLAS: Cortland. Seedling obtained from a cross between Ben Davis and McIntosh. Fruit possesses McIntosh aroma and color of flesh but is more attractive in color and keeps a little longer. Many growers believe this variety is a valuable new apple.

Early McIntosh. A seedling of Yellow Transparent x McIntosh introduced this year. Tree strong, vigorous, productive and an annual bearer. Should be very hardy. Fruits ripen with Red Astrachan but possess McIntosh color, shape, size and flesh characters. Its attractive color, earliness, high quality and tree characteristics make this new variety a most promising kind for dessert, kitchen and market.

Milton. <sup>New York</sup> A sister of Early McIntosh which is similar in appearance and quality but ripens one month later. Its main value is that it is a McIntosh type which ripens about one month before McIntosh. Tree is vigorous but not as large as that of Early McIntosh. Fruits are covered with a very attractive pinkish red and heavy bloom. Flesh is white, tender, crisp, juicy and of McIntosh aroma. Well worthy of trial.

Macoun. A seedling of McIntosh x Jersey Black. Fruits are medium in size and extremely attractive. Color solid dark red with slight mottlings and streaks, bloom heavy; flesh and flavor like McIntosh. Season is one month later than McIntosh, and two weeks later than Cortland. Its lateness, attractiveness and quality make it well worthy of trial.

Astrachan #2391. A Montgomery x Red Astrachan seedling which ripens from August 15th to September 15th. Its large fruits are covered with solid dark red and splashes and stripes of carmine. Flesh is white, tender, juicy, subacid and aromatic. Quality is good. Desirable for cooking and dessert. Tree has borne 3 years in succession and since fruit is larger and more attractive and fully as good as Red Astrachan, it is sent out for trial. If the seedling retains desirable characters, it will be named.

Medina. A Deacon Jones x Delicious seedling. The Deacon Jones combined with Delicious has given a large to very large fruit with Delicious flavor and appearance. Color is golden yellow mottled with light red and splashed with darker red, blue bloom; flesh yellowish, medium coarse, juicy, mild subacid and aromatic; quality very good; season December and January. Desirable for testing in localities where Delicious fruits are small.

Sweet Delicious. A Deacon Jones x Delicious seedling which is a true sweet apple of very attractive appearance. Fruits are large, roundish-oblate and slightly conic, entirely covered with dark red and blue bloom. Flesh is fine, yellowish-white, sweet, and slightly aromatic like Delicious. Quality very good. Season November and December. Very desirable as a high quality sweet apple for holiday trade.

Delicious #1940. A Delicious x Deacon Jones seedling which is much like Medina but ripens about one month earlier. Fruit very large and similar to Delicious in appearance and flesh characters. Quality very good. Desirable for dessert and market. Name will be given later if seedling retains its promising characteristics.

Red Spy. Probably a sport from the Northern Spy, at least it differs from this old standard in no apparent characteristic except color. Apples are of solid bright red color. Red Spy on account of its attractiveness should take the place of its well-known parent.

Yellow Transparent #2575. A Montgomery x Yellow Transparent seedling. Fruits ripen from end of July to August 15th and look like a Yellow Transparent but are much larger in size. Flavor is rather acid and so makes a desirable culinary apple. Promising as a substitute to Yellow Transparent on account of its superior size.

Sweet McIntosh. Lawver x McIntosh seedling. This new variety combines the beautiful Lawver color with the white aromatic flesh of McIntosh. Fruits average large or nearly so and are roundish-oblate in shape. Ripens in November. Of value for those who like a sweet apple and the McIntosh flavor.

PEARS: Dana Hovey. An old variety of delicious quality that should be grown in every pear-lover's orchard. Unfortunately it is no longer propagated and therefore a few trees have been grown for the members. Fruit is about the size of Seckel and is equally rich in quality. It ripens in December when many of the high quality pears are gone.

Gorham. A seedling of Bartlett x Josephine de Malines which resembles Bartlett greatly in appearance but ripens about one month later. Tree is very vigorous and productive; fruits are large to medium, and have a white, very fine-grained, juicy flesh. Equals Bartlett in quality. Desirable for dessert and market.

PLUMS: Agen or French Prune. A small prune of reddish-purple color. Flesh greenish-yellow, tender, sweet, aromatic; very good; stone nearly free. Ripens late and hangs to tree until it withers.

De Montfort. An extra high quality French plum which ripens early in the season. Fruits are medium in size, egg-shaped, and purple in color. Flesh is greenish, juicy, tender, very sweet and very good. A delicious free-stone plum which is desired by all those who have tasted it. Desirable for home and local market.

Hall. A seedling of Golden Drop x Grand Duke. A very large, reddish-purple, prune-shaped plum of very good quality. Flesh is yellowish-green, firm, meaty, tender, juicy and sweet. Stone semi-cling. Very promising plum owing to its size, color, and quality. Season at Geneva September 10th.

— Imperial Epineuse. A reddish-purple prune with a remarkably sweet flavor. Fruits ripen in late mid-season. Trees have grown well at Geneva and are recommended for trial.

✓ Pacific. A very large blue prune which ripens in mid-season. Owing to its good quality and size it should be tested in the East.

✓ Sannois. A very late reddish-purple French prune of medium size. Stone clings to flesh. Recommended for home garden on account of excellent quality.

✓ Formosa. A large, attractive and productive Japanese plum produced by Burbank. Fruits are light red to crimson with a lilac bloom and have a yellowish-flesh which is melting, sweet and very good. Season about August 15th. Valuable for home and local markets.

PEACH: ✓ Wilma. Seedling of Elberta grown by W. C. Rofkar, Port Clinton, Ohio. Tree vigorous and productive; fruit large, round-oval, much like Elberta; color yellow blushed red; flesh yellow, juicy, tender, pleasant, sprightly; very good. This seedling ripens about one week later than Elberta and gives promise of being an excellent variety to follow its parent.

GRAPES: ✓ Brocton. Seedling produced by crossing Brighton with (Winchell x Diamond) seedling. Clusters long and shouldered, berries medium to above in size, oval, yellowish-green, tender, sweet, aromatic, vinous, very good. Ripens with or before Niagara.

✓ Dunkirk. Seedling of Brighton x Jefferson. Clusters medium in size, compact; berries medium in size, roundish-oval, red, juicy, tender, slightly meaty, good to very good in quality.

✓ Keuka. A Chasselas Rose x Mills seedling of extra high quality. Vine has been hardy and of medium vigor. Clusters medium to below, compact; berries medium, oval, dark red with lilac bloom; texture meaty, tender; quality sweet, vinous, very good. Season early October.

✓ Ontario. A very early white grape produced by crossing Winchell with Diamond. Berries medium to small, roundish, juicy, tender, sweet and good in flavor. Superior in quality to Winchell and ripens slightly earlier.

✓ Portland. A seedling of Champion by Lutie. A very promising white grape similar in season to Ontario. Berries average large, round, pulp slightly tough, sweet, slightly foxy, good.

✓ Ripley. Winchell x Diamond. Fruit ripens with Niagara. Clusters average medium and are compact. Berries medium, roundish-oval, yellowish-green with juicy, meaty, tender flesh. Flavor very sweet and vinous. Quality very good.

✓ Sheridan. Same parentage as Pontiac but blossoms are self-fertilized. Clusters large and compact; berries large to medium, black, pulp medium tough, sweet, slightly foxy, good to very good. Skin thick and tough. Good keeper, ripens about one week later than Pontiac and Concord.

✓ Urbana. Seedling of Ross by Mills. Clusters large, compact; berries large to small, oval, dark red; flesh crisp, meaty, sweet, vinous, very good. Season late. Recommended for localities with a long season.

(Noteworthy varieties)

+ — Canandaigua. A black grape with clusters variable in size; berries large to medium, slightly oval; flesh firm, sweet and rich, good. Flowers self-sterile. Ripens after mid-season. Recommended for its long keeping quality.

— Thompson #5. Another black grape which possesses remarkable keeping quality. Clusters medium; berries nearly large, roundish; flesh rather tough, juicy, very sweet and good. Flowers self-sterile. Recommended only for home garden.

STRAWBERRIES: ✓ Beacon. Seedling of President by Marshall. Plants vigorous and productive; flowers perfect; fruit ripens early, large, blunt wedge to blunt conic, medium to dark red, glossy; flesh red to center, juicy, firm, subacid, good. Holds up size well. Very promising for an early.

✓ Bliss. Seedling of Chesapeake by Atkins Continuity. Plants vigorous and very productive; flowers perfect; fruits ripen late midseason; large to medium, blunt-conic to blunt-wedge, medium red, very glossy, very juicy, medium to firm, mild, sweet or pleasantly sprightly, highly flavored, good to very good. One of the best grown at Geneva.

? Bouquet. Seedling of Chesapeake x Pan American. Plants vigorous, medium to productive; flowers perfect; fruit ripens early midseason, very large to medium, blunt-wedge to blunt-conic, medium to light-red, glossy; flesh well colored to center, juicy, very firm, subacid, good. Makes good combination with other two.

RASPBERRIES: ✓ Cayuga. Seedling of June by Cuthbert. Plants very vigorous and very productive. Berries large, roundish-conic; drupes medium, strongly coherent, medium red, slightly glossy, juicy, firm but tender, sprightly, aromatic, very good. Berries resemble Cuthbert in appearance and nearly equal this variety in flavor.

✓ Seneca. Seedling of June x Cuthbert. This new variety is very similar to Cayuga except the drupelets average slightly larger, berries slightly more conic and flavor slightly more sprightly and the season a few days later.
